iOS and Android mobile app (Expo)

LinkCard Event Admin

On-site handbook

Event organisers and door staff

Who this handbook is for

- **Organiser**：Owns the event. Can read the roster, settings and every door tool.
- **Door staff**：Trusted to check people in and work the NFC desk, but cannot read the full roster.

How to use this handbook

- Each section is one job. Follow the numbers and you have done that job.
- The circled numbers on a picture match the table underneath it.
- If your screen looks different, read that step's note first. The difference usually has a reason.
- Anything marked as not yet available means a person has to handle it by hand for now.

How these screens were captured

> Screens were captured in a phone-sized browser window (390 x 844 at 2x). Camera and NFC are phone hardware, so the app's own notices appear on those screens instead of a live view.

The phone app, or the laptop check-in desk?

This app's NFC writing has **not** been retired: it still works and still issues cards. The new "Web check-in desk" is a **second** route, not a replacement. From now on both routes exist on site at the same time, and picking the wrong one costs you a queue.

The rule in one line: if you have a laptop and a reader, use the laptop check-in desk; if you have only a phone, use this app.

What you have	Which route	The difference
Laptop + an ACR1555U reader + Chrome or Edge	**Web check-in desk** (laptop)	Scan the QR, press "Write this card"; the system builds the card URL, binds it and reads it back to verify
Only a phone (iPhone or Android), no reader	**This app** (phone NFC, Part 5, E1–E2)	The phone is the reader; no extra hardware is involved
iPad, an Android tablet, Safari, Firefox	**Neither route works**	The web route needs Web Bluetooth, which none of these provide; switch to one of the routes above

> **Never write the same card from both routes.** Once one side has bound it, that is final; if you try both, one side succeeds and the other reports that the card already belongs to someone.

The full laptop procedure (connecting the reader before the doors open, the six reader states, the nine failure branches, the yellow "written but not registered" case, and the list of things not to do) lives in a separate book: **"Web check-in desk — on-site operating manual"** (`LinkCard_Frontend/docs/handbook/web-checkin-desk-zh.md`, in Chinese). This book does not repeat it; do not mix the two.

Contents

Part 1: Getting started

A1	Sign in to the app	4 steps
A2	Pick the event you are working on	3 steps
A3	Check the phone status and sign out	3 steps

Part 2: Before the doors open

B1	See where the event stands	3 steps
B2	Check the badge inventory	3 steps
B3	Get to know the roster	3 steps

Part 3: Checking people in

C1	Check someone in by scanning	3 steps
C2	When the camera will not work, type the code	5 steps
C3	Read the four check-in outcomes	4 steps
C4	Register someone on the spot	4 steps

Part 4: The roster and looking people up

D1	Find someone on the roster	3 steps
D2	Open one person's full record	3 steps
D3	Why door staff cannot open the roster	2 steps

Part 5: NFC wristbands

E1	Write a wristband for an attendee	4 steps
E2	Read a card number and exchange contacts	4 steps

Part 6: When things are not normal

F1	The token desk, and what to do when the network drops	4 steps

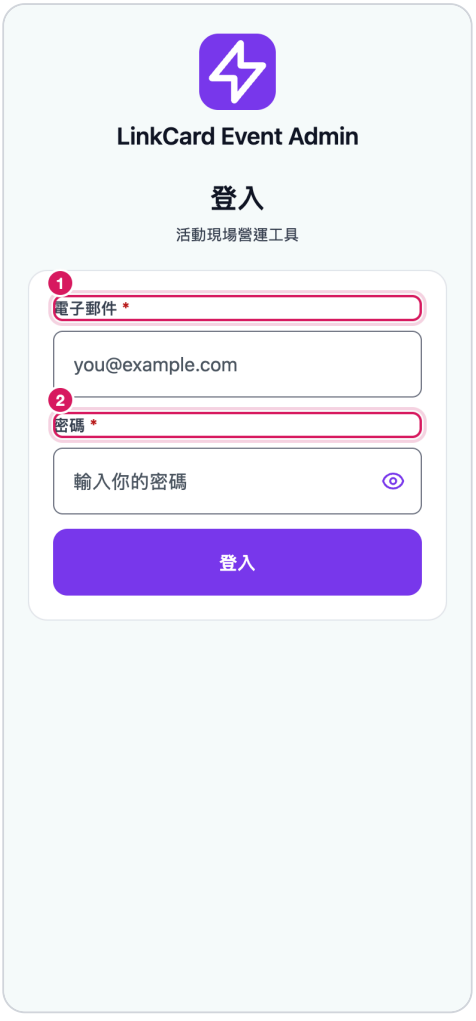

Part 1: Getting started

A1 Sign in to the app

Who	Organiser
When	The first time you open the app, or after switching devices.
What you want	Get into your own account and see the events you run.
Before you start	You have the email and password your event owner gave you.
When you are done	You land on My events and can pick an event.

A1–1 Open the app.

What you see： The sign–in screen appears, asking for your email and password.

1 Email field

2 Password field

A1–2 Tap the email field and type your email address.

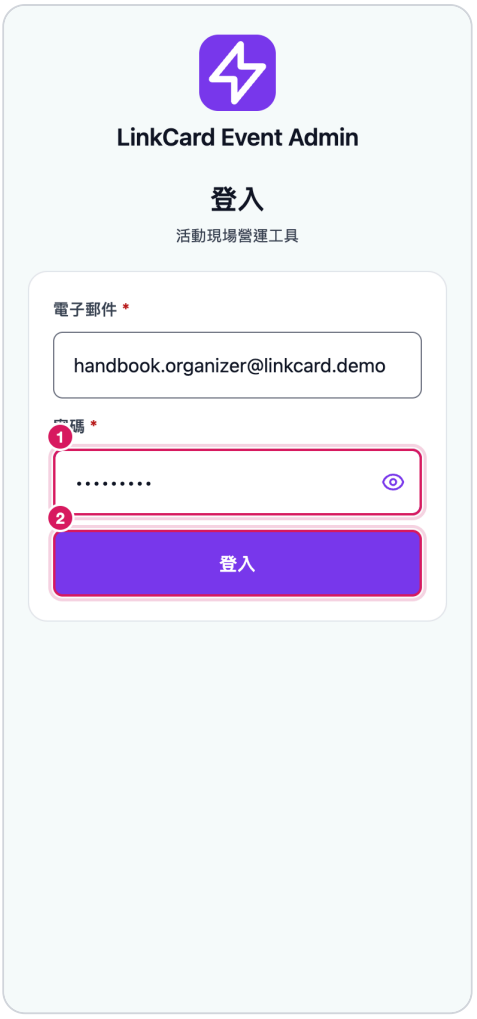

What you see： The text you type shows in the field.

1 Your email

A1–3 Tap the password field, type your password, then press Sign in.

What you see：The password shows as dots. The eye icon on the right reveals it, in case you mistyped.

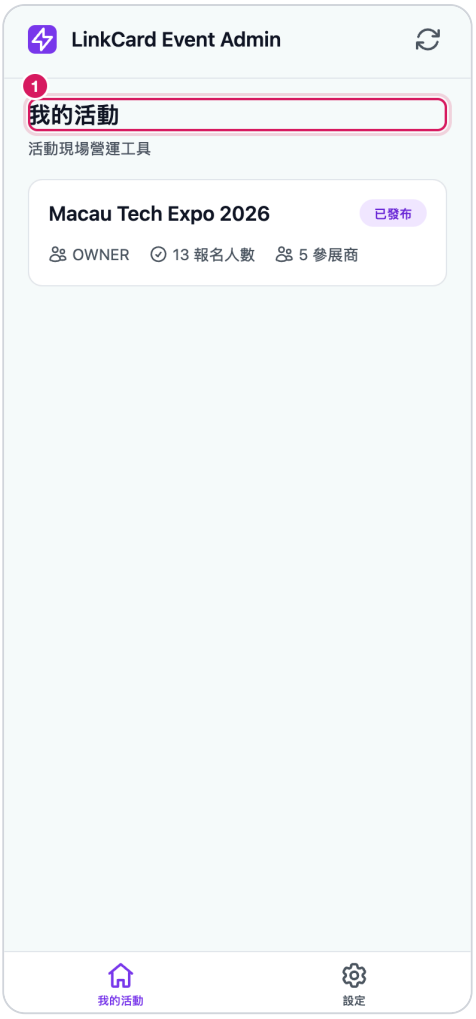

1 Password field (shown as dots)

2 Press to sign in

A1–4 Press Sign in.

What you see： You go straight to My events, listing the events you are responsible for.

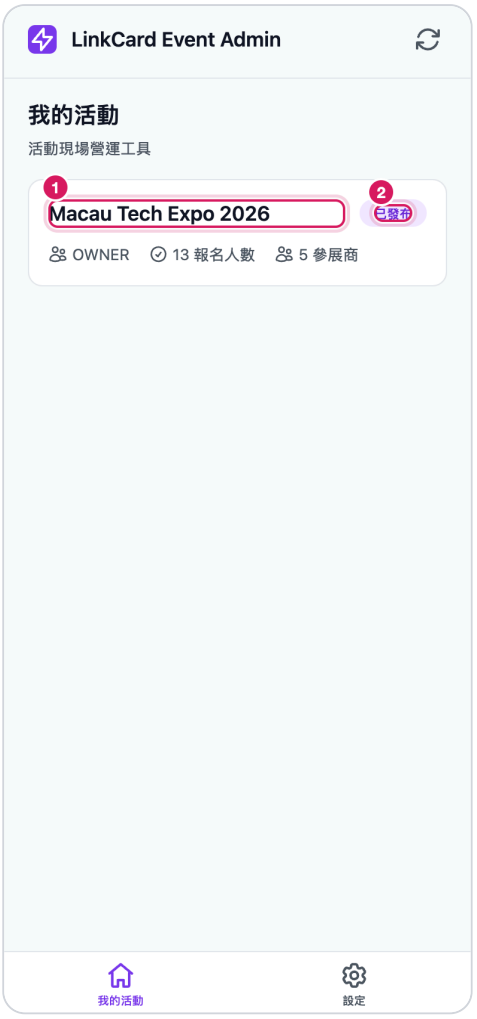

1 You are signed in; this is your event list

A2 Pick the event you are working on

Who	Organiser
When	Every time you open the app.
What you want	Get into the tools for the right event.
Before you start	You are signed in.
When you are done	You are on that event's Overview.

A2–1 Find the event you are working on in My events.

What you see： Each card shows the event name, status, your role, and the number of registrations and exhibitors.

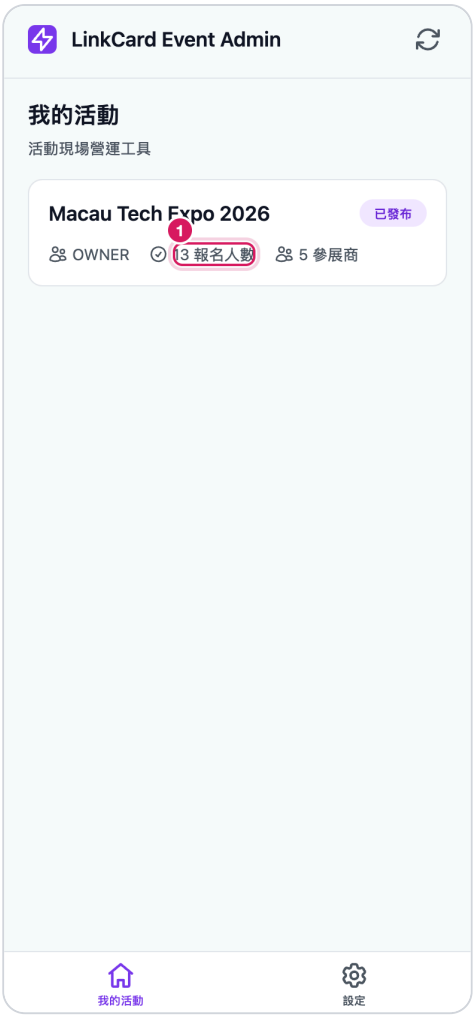

1 Event name

2 Event status

A2–2 Check the numbers on the card to be sure it is the right event.

What you see：The registration and exhibitor counts sit under the name, no need to open it.

1 Registration and exhibitor counts

A2–3 Tap the event card.

What you see：You arrive at Overview, with this event's live numbers at the top.

1 You are now inside this event's overview

A3 Check the phone status and sign out

Who	Organiser
When	Before doors open to confirm the device is fine, or before handing the phone to someone else.
What you want	Confirm the app version and whether NFC works, and sign out safely when needed.
Before you start	You are signed in.
When you are done	You know whether this phone can write badges; after signing out you are back at the sign-in screen.

A3-1 Tap Settings in the bottom bar.

What you see： You see two sections: Account and Device.

1 You are on the settings tab

2 The account section

A3–2 Look at the NFC status row.

What you see： Supported means this phone can write and read badges. Not supported means you need another phone for NFC work.

1 NFC status decides whether this phone can write badges

2 Quote this version when reporting a problem

A3–3 When handing the phone over, scroll down and press Sign out.

What you see： You return to the sign–in screen, so the next person cannot see your event data.

1 Press this before handing the phone over

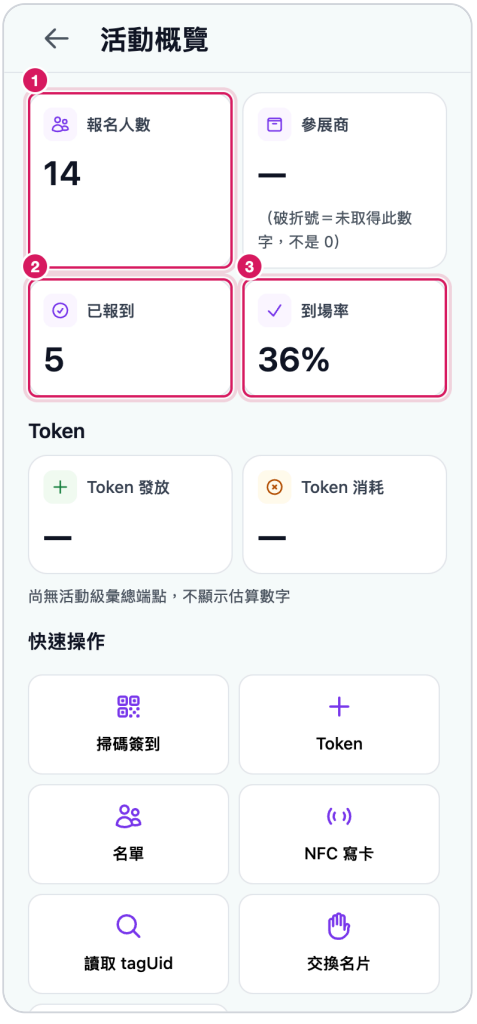

Part 2: Before the doors open

B1 See where the event stands

Who	Organiser
When	Before doors open, and every so often during the day.
What you want	Read registrations, check-ins and attendance rate at a glance.
Before you start	You are inside the event.
When you are done	You know how the door is going and can jump straight to a tool.

B1-1 Open this event's Overview.

What you see： Four figures: registrations, checked in, exhibitors, attendance rate.

1 Registrations

2 Checked in

3 Attendance rate

B1–2 If a figure shows a dash instead of a number, read the note under it.

What you see：A dash means the figure could not be read, not that it is zero. The note explains why.

1 What the dash means

B1–3 Scroll to Quick actions, the shortcuts you will use most on the door.

What you see：Seven buttons: scan check–in, Token, roster, write NFC badge, read tagUid, exchange contacts, badges.

1 Scan check–in: the one you use most

2 Roster: to look someone up

3 Write NFC badge: to issue a wristband

B2 Check the badge inventory

Who	Organiser
When	Before doors open, and whenever you run out of wristbands.
What you want	Know how many blank badges are left and how many are already issued.
Before you start	You are inside the event.
When you are done	You know whether you need to open a fresh batch.

B2–1 Press Badges in Quick actions.

What you see：A lookup box on top, and every badge for this event below.

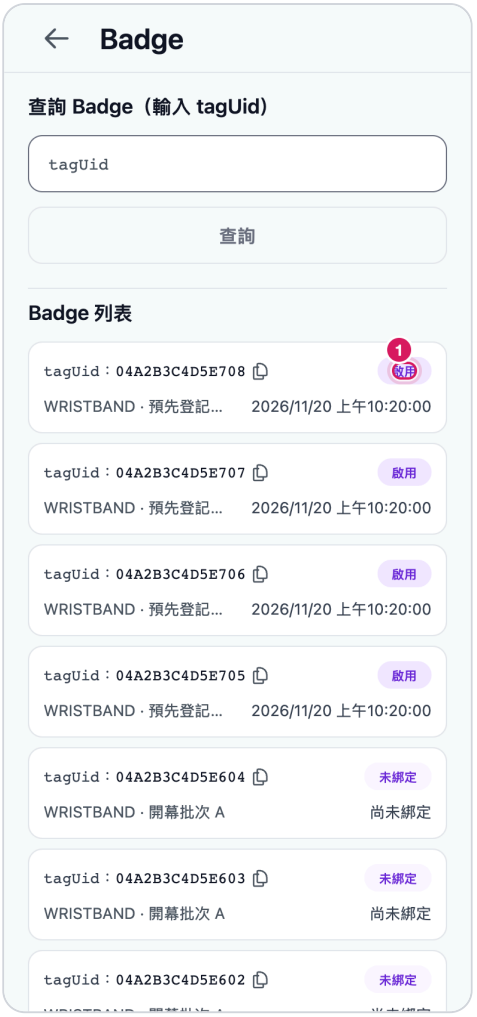

1 Use this when you know the card number

2 The full list

B2–2 Read the status label on each card.

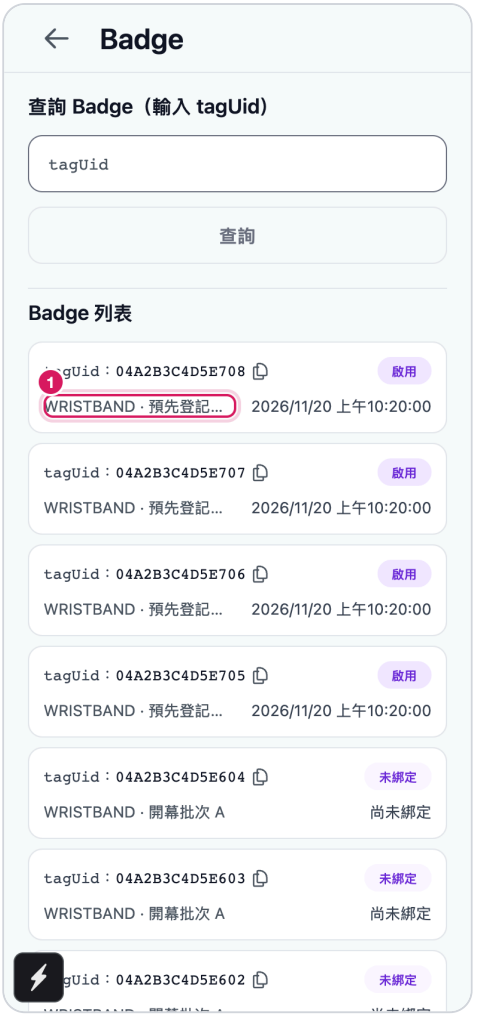

What you see：Unassigned means a blank badge not yet issued. Active means it is on someone and in use.

1 Issued and in use

B2–3 Read the batch name on each card.

What you see：The batch name tells you which stack the badge came from, which makes reconciling easier.

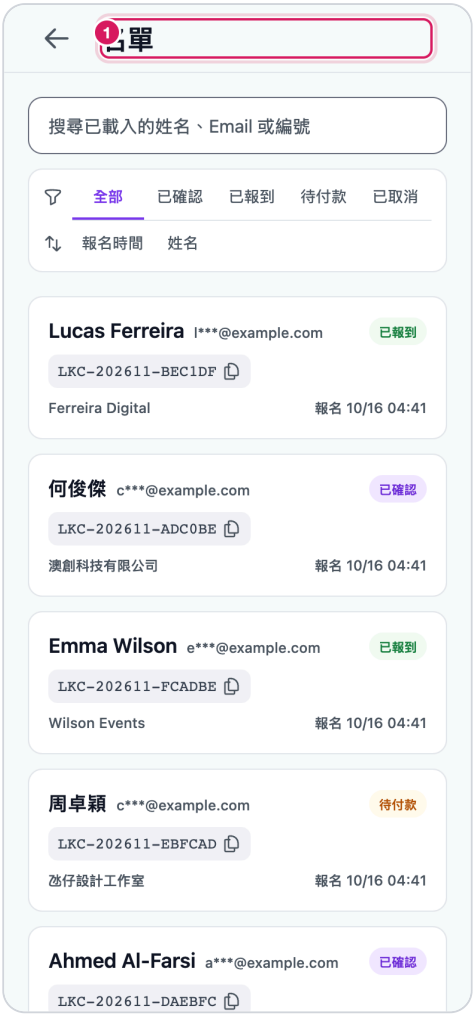

1 Batch name

B3 Get to know the roster

Who	Organiser
When	Before doors open, to see who is coming.
What you want	Understand what each row on the roster is telling you.
Before you start	You are inside the event, and your account is allowed to read the roster.
When you are done	You know how to read a registration row and how to copy a registration code.

B3–1 Press Roster in Quick actions.

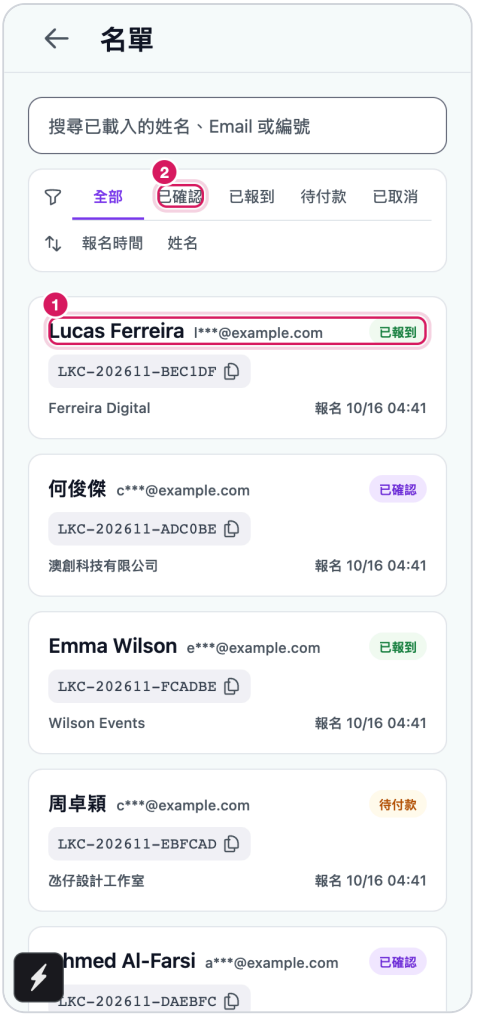

What you see： You see this event's list of registrations.

1 The roster

B3–2 Read one registration row.

What you see： Left to right: name, email (partly starred for privacy), status label, registration code, company, and when they registered.

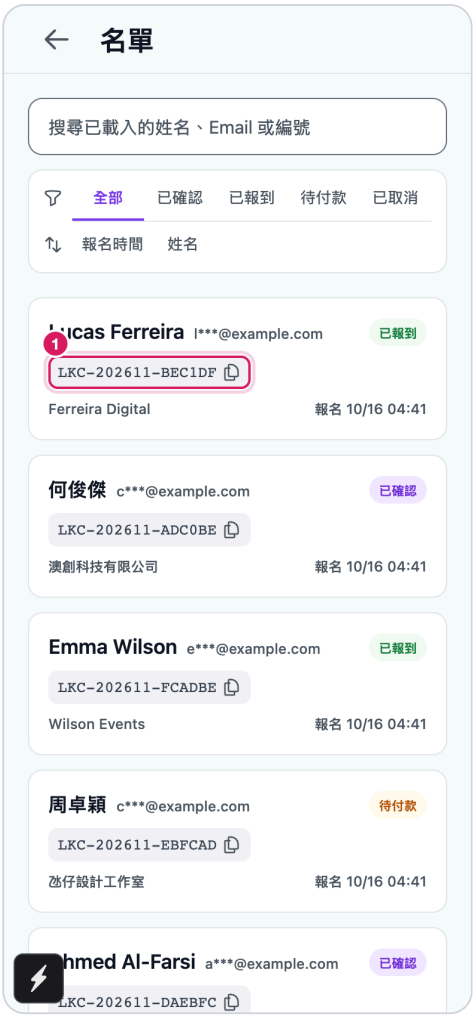

1 One row is one registration

2 Status: confirmed means they may enter

B3–3 Tap the registration code.

What you see：The code is copied so you can paste it elsewhere or send it to a colleague.

1 Tap to copy the code

Part 3: Checking people in

C1 Check someone in by scanning

Who	Door staff
When	When an attendee holds up a QR code on their phone or on paper. This is the fastest way.
What you want	Turn a QR code into a check–in record.
Before you start	You are on the scan screen for this event and the camera works.
When you are done	The result appears, then the screen returns to scanning after about 15 seconds, ready for the next person.

C1–1 Press Scan check–in in Quick actions.

What you see：The running check–in total sits on top, with the scanning frame below.

1 Running check–in total

2 Aim the QR code at this frame

C1–2 Check that you are in scan mode.

What you see：Two tabs sit at the top: scan mode uses the camera, typing uses the keyboard.

1 Currently using the camera

2 Press here when the camera will not work

C1–3 Point the phone at the QR code. If the screen says the camera is unavailable, read the two options it offers.

What you see： Allow camera asks for permission again; switch to typing turns this into manual entry straight away. Neither sends the attendee back to the queue.

1 Try reopening the camera first

2 Press here if the camera genuinely will not work

> **About this image：** Captured in a browser, which has no NFC, so the app's own notice appears. On a phone that notice is absent; everything else is the same. The physical tap itself cannot be demonstrated in a browser.

C2 When the camera will not work, type the code

Who	Door staff
When	When the QR code is damaged, the screen reflects, or another app is holding the camera.
What you want	Still check the person in, without sending them back to the queue.
Before you start	You are on the scan screen for this event.
When you are done	You get the same result as scanning.

C2–1 When the camera will not work, try Allow camera first.

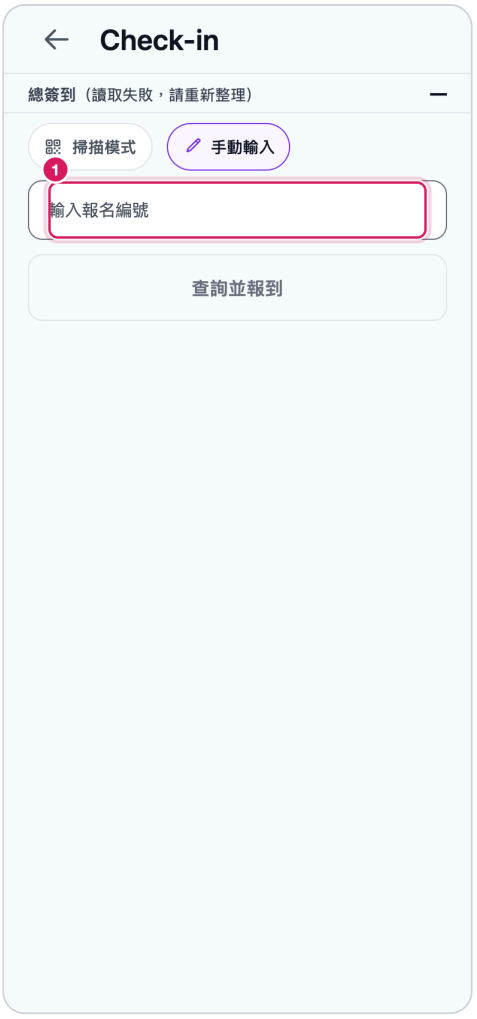

What you see：Usually one press is enough, without leaving this screen.

1 Try this first

C2–2 If it still will not work, press Switch to typing.

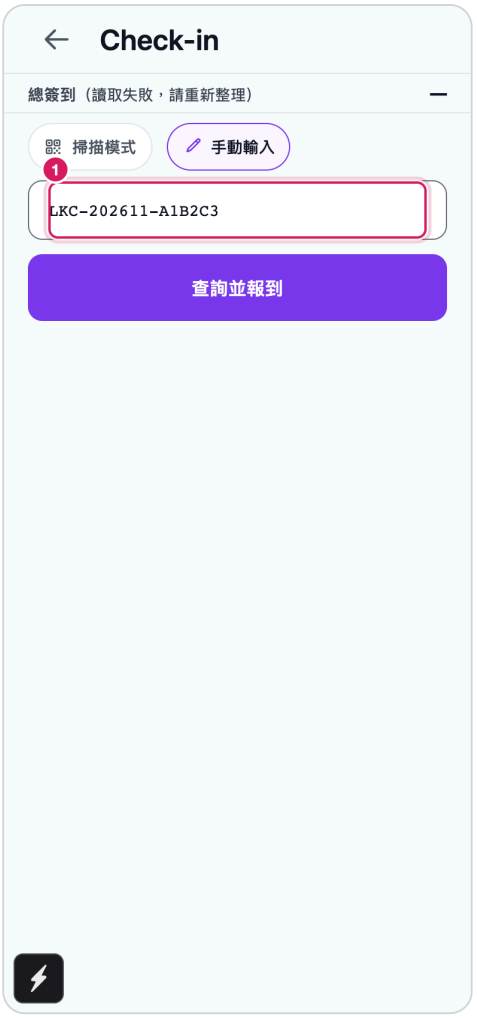

What you see： The scanning frame becomes a text box you can type a registration code into.

1 Type the registration code here

C2–3 Type the registration code the attendee gives you.

What you see： Case does not matter, and stray spaces are fine; the system corrects them.

1 The code you just typed

C2–4 Press Look up and check in.

What you see：The screen shows Checking, then the result card appears.

1 This is what you check after submitting

C2–5 Read the result card.

What you see：A green Checked in, with the name, ticket type and check–in time on the card. Let them through.

1 Success, let them through

2 Check the ticket type is right

C3 Read the four check-in outcomes

Who	Door staff
When	After every check-in.
What you want	Know which outcome lets someone through and which needs a supervisor.
Before you start	You have completed at least one lookup.
When you are done	You know what to do next for every outcome.

C3-1 Outcome one: the ticket is valid and is now checked in.

What you see：A green Checked in headline. Let them through.

1 Let them through

C3–2 Outcome two: this person was already checked in.

What you see：The headline says Already checked in. Do not wave them through again; ask whether they already entered.

1 Not a new arrival, confirm first

C3–3 Outcome three: the ticket cannot be found.

What you see：The headline says Invalid registration. Check for a typo first, then ask for their original confirmation email.

1 Do not let them through

C3–4 Outcome four: the connection is the problem.

What you see：The screen reports a network failure. That is not the same as an invalid ticket: the ticket may be fine. Verify by hand or switch networks, but do not treat it as fake.

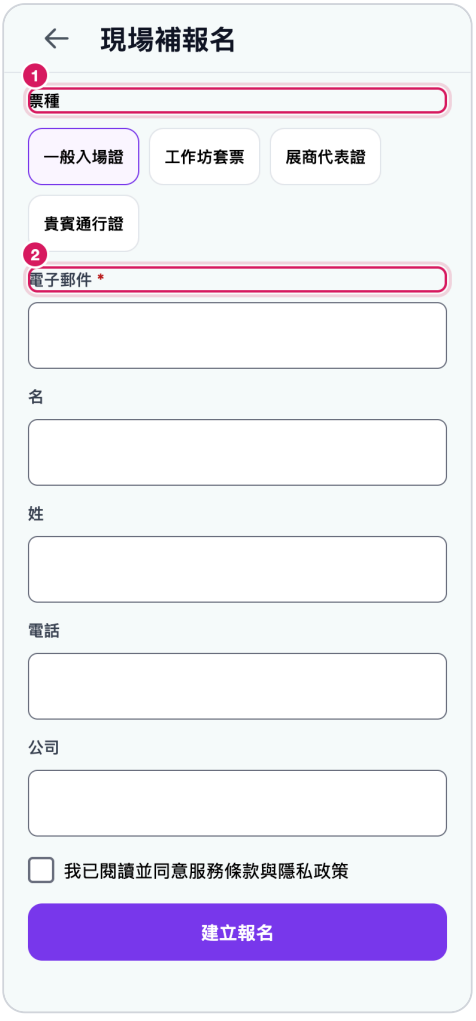

1 A network problem, not a ticket problem

C4 Register someone on the spot

Who	Door staff
When	Someone turns up without having registered.
What you want	Create a registration for them, then check them in as usual.
Before you start	You know which ticket type to give them.
When you are done	The roster gains a record, and you can carry straight on to check-in or badge writing.

C4-1 Open walk-in registration.

What you see： Ticket types and fields appear. Email is required, and first and last name are separate.

1 Choose the ticket type first

2 Email is required

C4–2 Fill in the attendee's details.

What you see：Complete the starred fields. Phone and company are optional.

1 Email: required

C4–3 Read the terms to the attendee, tick consent, then press Create registration.

What you see： Consent must be ticked or the button will not go through.

1 The result after submitting

C4–4 Read the confirmation, then carry on to check-in or badge writing.

What you see： Note: for a paid ticket the registration exists but is unpaid, so it does not count as entry.

1 Carry straight on to check-in

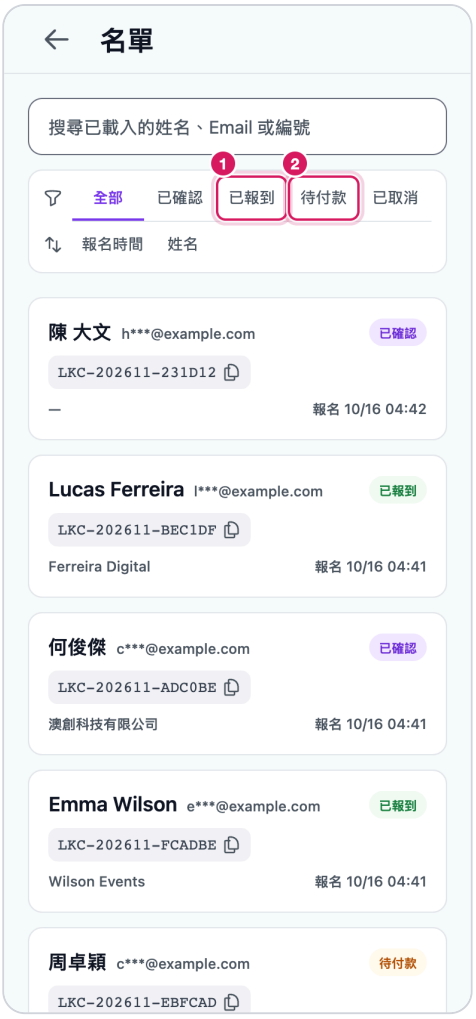

Part 4: The roster and looking people up

D1 Find someone on the roster

Who	Organiser
When	Someone asks about their registration, or you need to confirm whether a person has arrived.
What you want	Find that person in seconds.
Before you start	You are on the roster screen.
When you are done	You found them and can open their detail.

D1–1 To see one status only, press a filter chip at the top.

What you see：You can choose all, confirmed, checked in, awaiting payment, or cancelled.

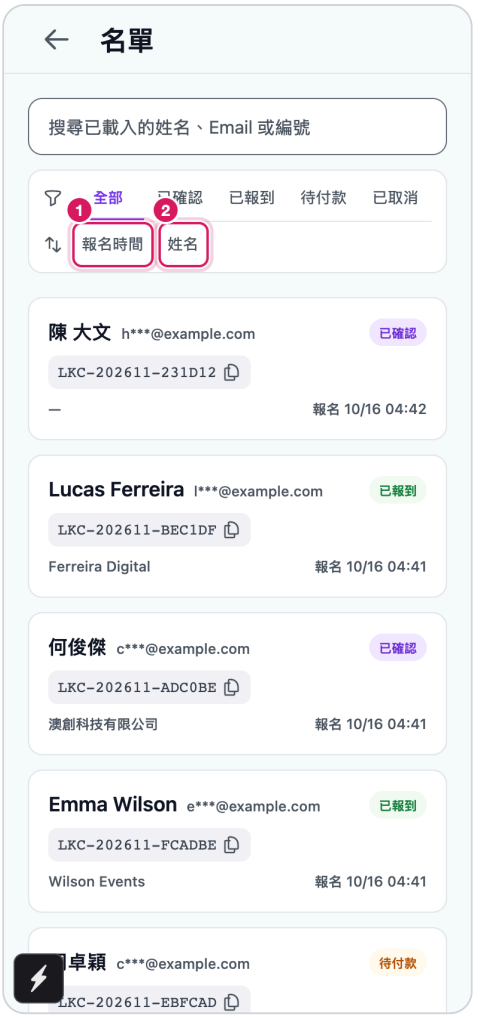

1 Show only people who have checked in

2 Show only unpaid registrations

D1–2 To re-sort, press Registered or Name.

What you see：The list re-sorts straight away.

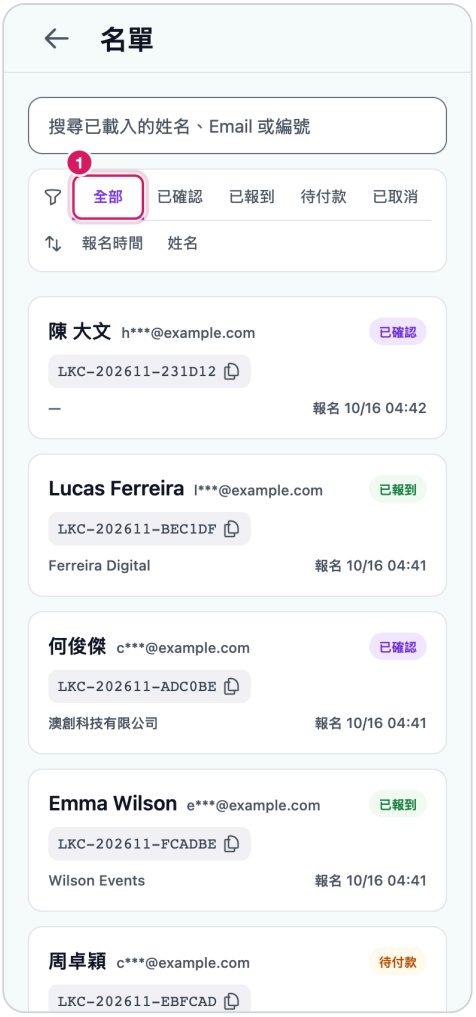

1 Sort by registration time

2 Sort by name

D1–3 If you cannot find them, clear the filters and scroll down.

What you see： If nothing matches, the screen says there are no matching registrations and suggests clearing the filters.

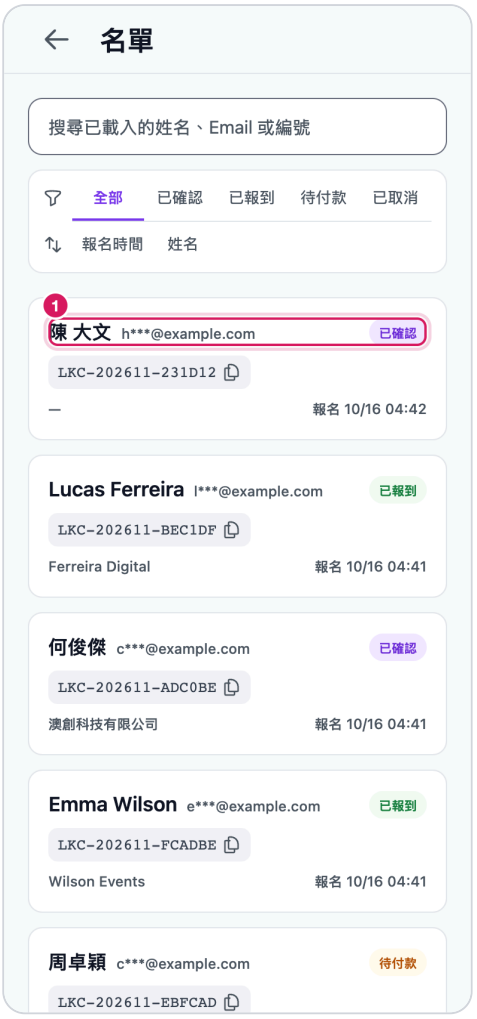

1 Press to show everything

D2 Open one person's full record

Who	Organiser
When	When you need to confirm a check-in time, a token balance, or a ticket type.
What you want	See everything about one person on a single page.
Before you start	You are on the roster screen.
When you are done	Press Back to return to the roster.

D2-1 Tap the row with that person's name.

What you see：You enter the detail view. Note: tapping the registration code only copies it, it does not open the detail.

1 Tap the name row to open the detail

D2–2 Read the Profile and Registration sections.

What you see： Name, email, phone, company, ticket type and registration time are all here.

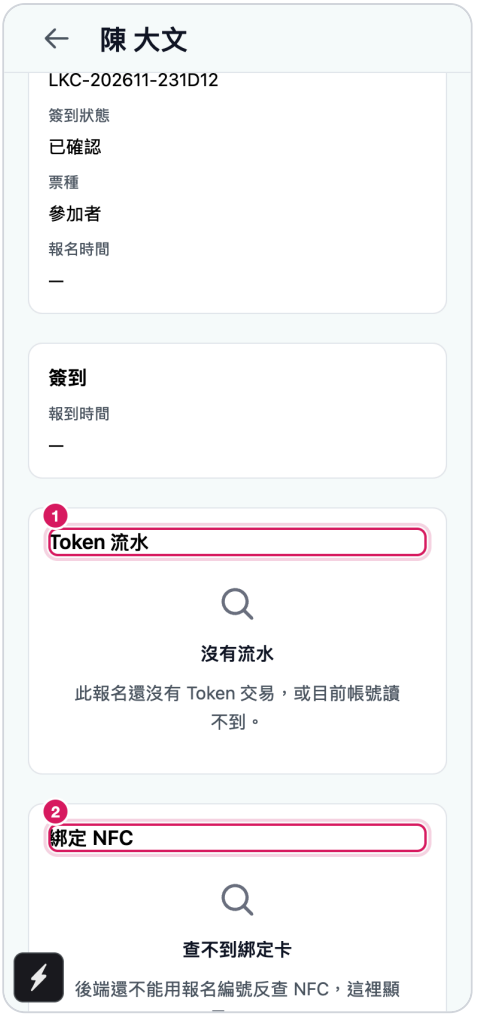

1 Their details

2 This ticket's details

D2–3 Scroll to the Check-in, Token history and NFC sections.

What you see：If a section shows a dash or says no bound badge was found, the backend simply has no record yet. It does not mean something is broken.

1 Token history

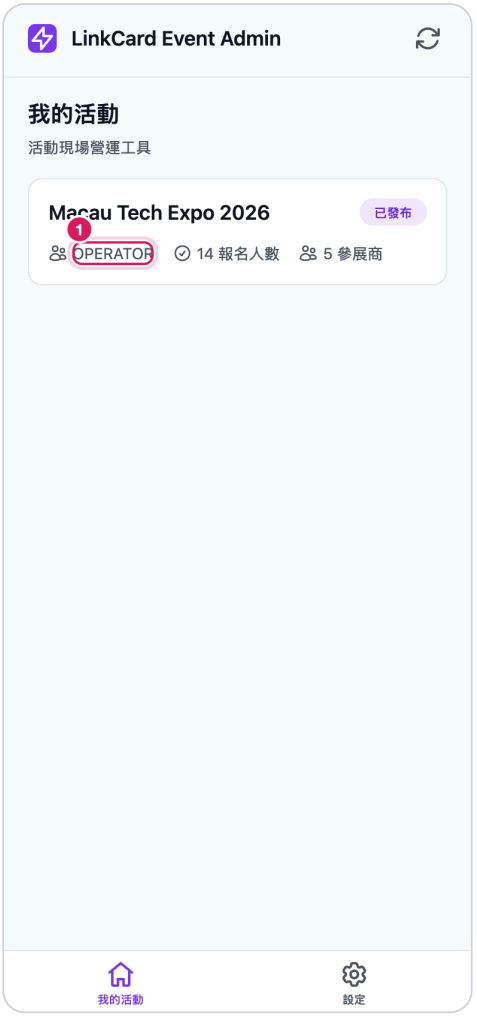

2 The wristband bound to this person

D3 Why door staff cannot open the roster

Who	Door staff
When	You signed in with the door account and the roster will not open.
What you want	Understand this is a permission boundary, not a broken phone.
Before you start	Signed in with the door-staff account.
When you are done	You know to switch to an owner or coordinator account to read the roster.

D3-1 Sign in with the door-staff account.

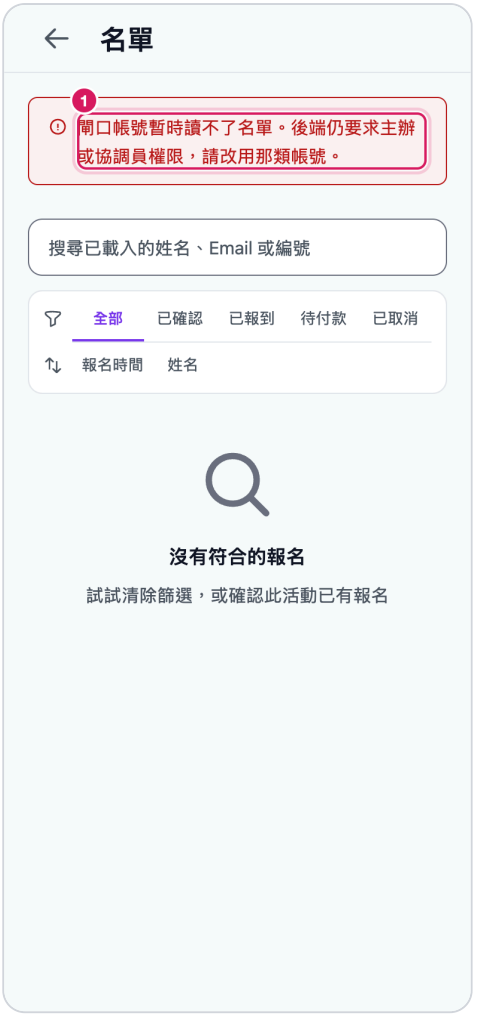

What you see：The event card shows your role as OPERATOR rather than OWNER.

1 You are signed in as door staff

D3–2 Open the roster anyway.

What you see：The screen explains that the roster needs an owner or coordinator account on the backend. Check-in and badge writing are unaffected.

1 A permission limit, not a fault

Part 5: NFC wristbands

E1 Write a wristband for an attendee

Who	Door staff
When	An attendee has checked in and needs a wristband to enter.
What you want	Bind one blank wristband to one attendee.
Before you start	You have blank wristbands and the phone supports NFC.
When you are done	The wristband is bound and ready to hand over.

E1–1 Press Write NFC badge in Quick actions.

What you see：Step one appears: enter a registration code to look up the attendee.

1 Step one: find the person

2 Replace, reissue and return are not available yet

About this image：Captured in a browser, which has no NFC, so the app's own notice appears. On a phone that notice is absent; everything else is the same. The physical tap itself cannot be demonstrated in a browser.

E1–2 Enter the attendee's registration code, or arrive from the check–in result card.

What you see：Once found, the screen shows their name and ticket type so you can confirm.

1 Enter the registration code

E1–3 Press Look up and check in.

What you see：Step two appears: choose a badge type, then hold a blank card to the back of the phone.

1 Choose a type, then press this

E1–4 Read the line under the button: the card number is only known at the moment of the tap.

What you see： So the confirmation screen shows a template URL, not the final one written to the card. That is expected.

1 The tap starts only after you press

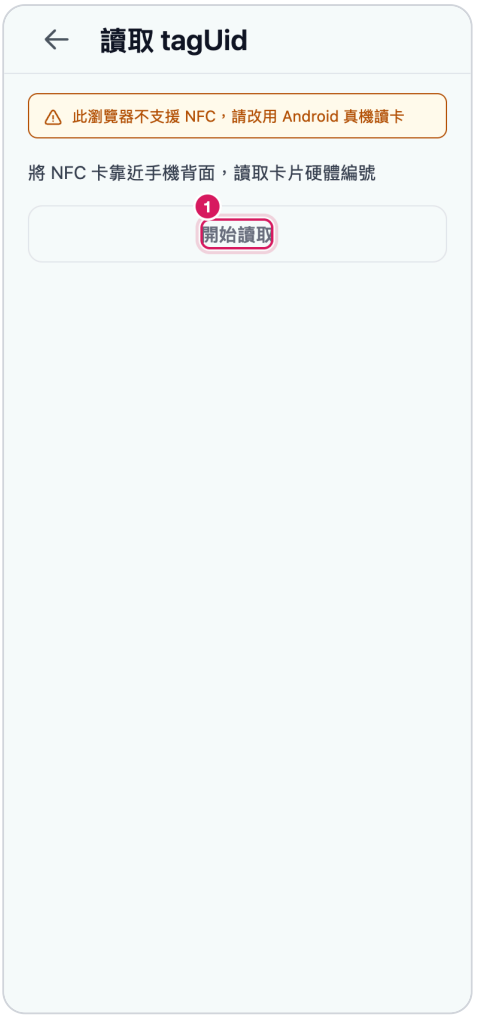

About this image： Captured in a browser, which has no NFC, so the app's own notice appears. On a phone that notice is absent; everything else is the same. The physical tap itself cannot be demonstrated in a browser.

E2 Read a card number and exchange contacts

Who	Door staff
When	You need to identify whose wristband this is, or two attendees want to swap details.
What you want	Read a card number, or record one exchange with two taps.
Before you start	The phone supports NFC.
When you are done	You have the card number, or one exchange is recorded.

E2–1 Press Read tagUid in Quick actions.

What you see：The screen asks you to hold the card to the back of the phone to read its hardware number.

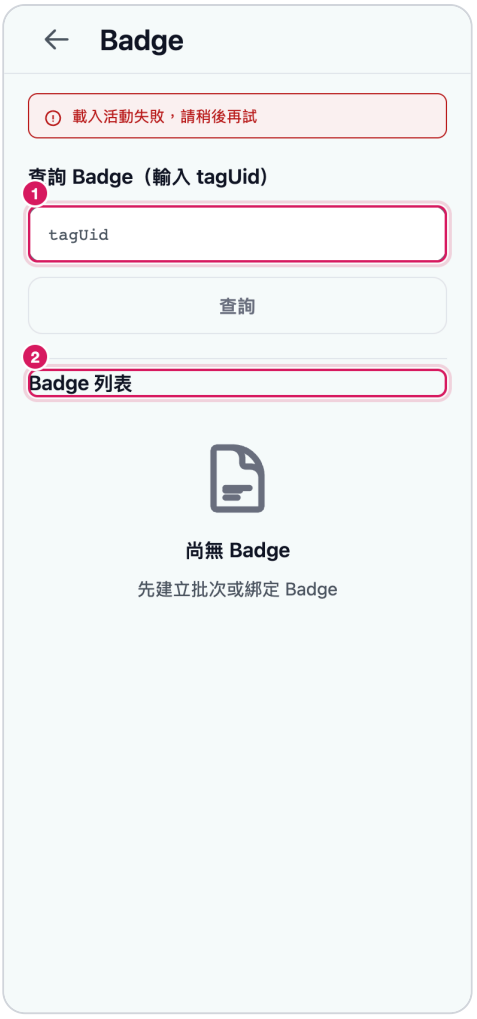

1 Press, then tap the card

> **About this image：**Captured in a browser, which has no NFC, so the app's own notice appears. On a phone that notice is absent; everything else is the same. The physical tap itself cannot be demonstrated in a browser.

E2–2 Once read, copy the card number and look it up on the badge page.

What you see：The lookup box on the badge page takes exactly this number.

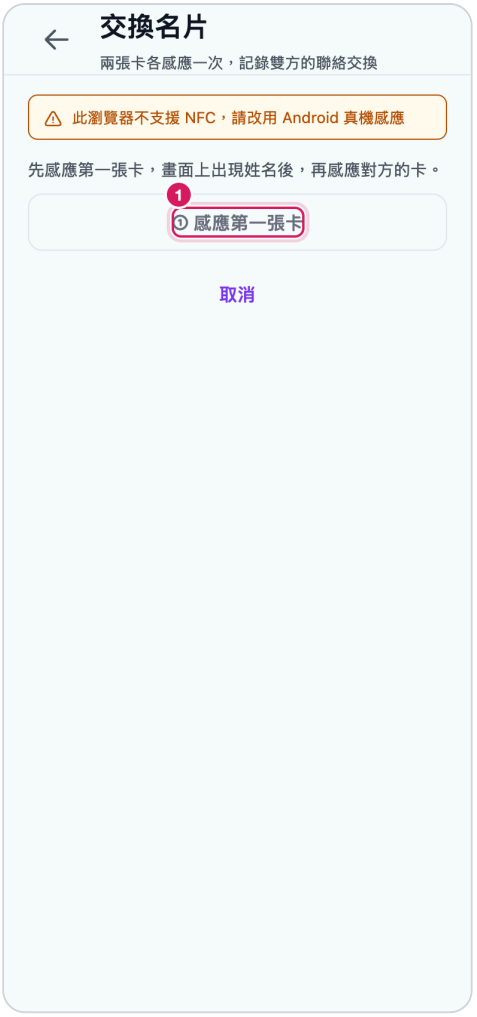

1 Paste the card number to look it up

2 Or scan the list instead

E2–3 To let two people swap details, open Exchange contacts.

What you see：The screen states the order: tap the first card, wait for the name, then tap the other person's card. The order matters.

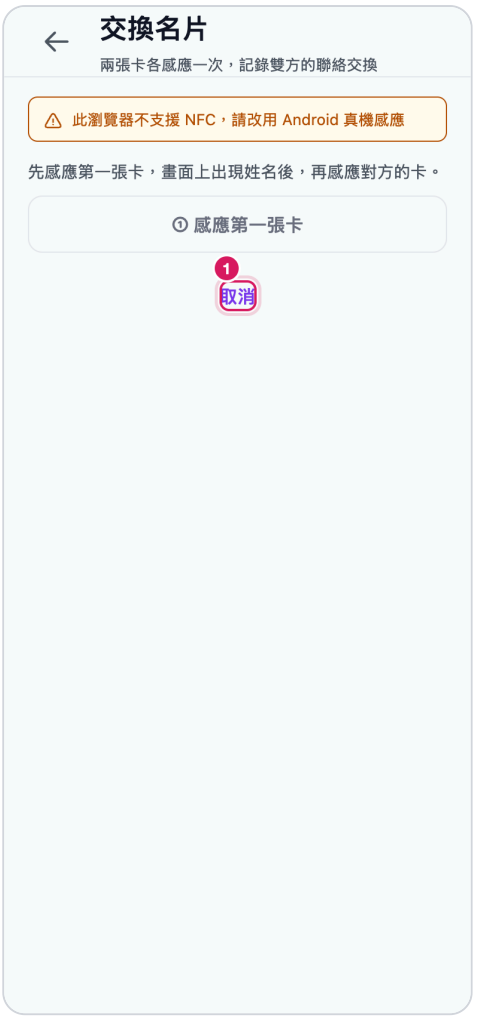

1 Tap the first card first

> **About this image：**Captured in a browser, which has no NFC, so the app's own notice appears. On a phone that notice is absent; everything else is the same. The physical tap itself cannot be demonstrated in a browser.

E2–4 If you need to stop, press Cancel. The first card's state is released and no half-record is left behind.

What you see： If it says already exchanged, these two cards met before and nothing was written twice. That is normal.

1 Press here to abandon mid-flow

> **About this image：** Captured in a browser, which has no NFC, so the app's own notice appears. On a phone that notice is absent; everything else is the same. The physical tap itself cannot be demonstrated in a browser.

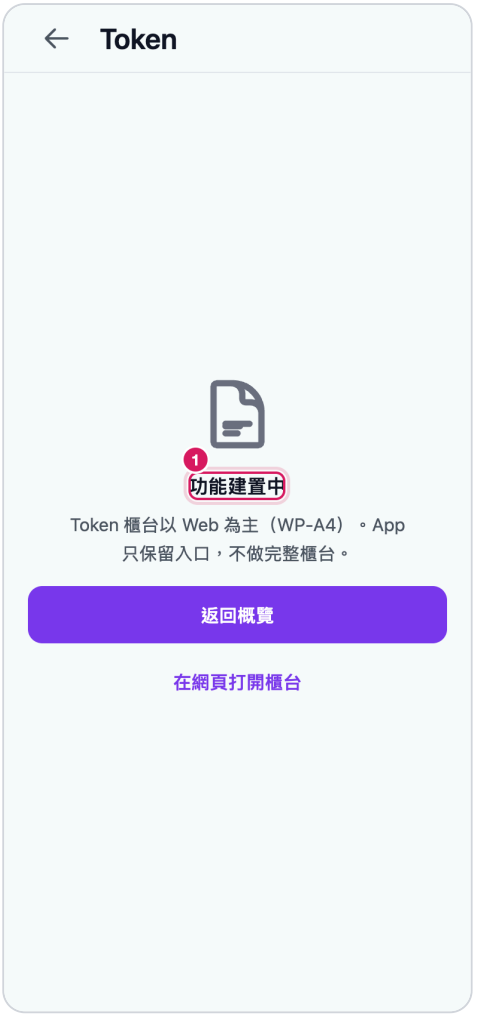

Part 6: When things are not normal

F1 The token desk, and what to do when the network drops

Who	Organiser
When	An attendee wants tokens, or the venue network is patchy.
What you want	Know that the token desk lives on the web, and how to handle a connection problem.
Before you start	You are inside the event.
When you are done	You will not hunt for token features in the app, and will not mistake a network problem for a fake ticket.

F1–1 Press Token in Quick actions.

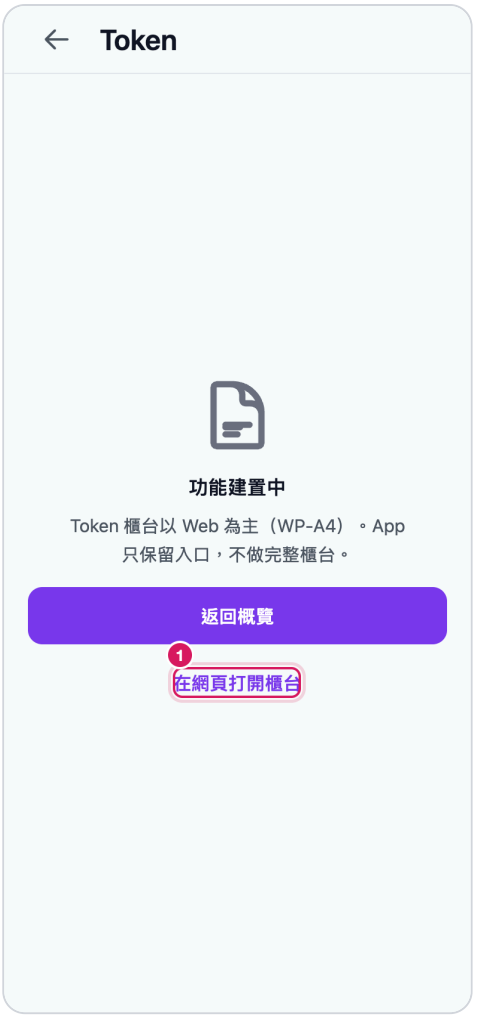

What you see：The app explains that the token desk is web–first and this is only a doorway.

1 The app does not host the full desk

F1–2 Press Open the desk on the web.

What you see： It opens the web console in your phone's browser, where the same account works.

1 Top-ups and deductions happen on the web

F1–3 If check-in reports a network or server problem.

What you see：This is not the same as a registration not being found. The ticket may be fine: verify by hand or switch networks, but do not treat it as fake.

1 When the network is patchy, switch to typing and retry

F1–4 For a duplicate or an exception you want to allow, press Request supervisor override.

What you see： This feature is not open yet. The screen states the backend is not ready, so let the person through by hand and keep a written record rather than changing data yourself.

1 Not available yet, handle it by hand

Automatic checks

> These ran against the manifest, the screenshots and this document as it was built. They are recorded so you can see what was verified, and what was not.

**11 / 11 pass · undefined Journey · [object Object],[object Object],[object Object],[
